Knowledge Base Entry — Technical Communication & UX Evaluation

Technical Communication Intern — raffle.ai

Role Overview

Short-term internship focused on improving technical communication quality and user experience in a product-oriented AI company. The role emphasized clarity, usability, and consistency across documentation and interfaces, bridging the gap between technical implementation and user understanding.

Core Responsibilities

- Updated and expanded **technical and user-facing documentation**, ensuring accuracy, clarity, and consistency.
- Created **visual guides and walkthroughs** to support onboarding and product understanding.
- Evaluated UX and UI by:
    - Identifying usability issues, inconsistencies, and friction points
    - Reporting bugs and unclear user flows
- Analyzed user interactions and documentation structure to determine where users were likely to misunderstand or disengage.
- Presented findings and **actionable recommendations** to improve both documentation clarity and overall user experience.

Job-Focused Impact & Transferable Value

- Strengthened the ability to **translate complex technical systems into accessible explanations** without oversimplifying.
- Applied a user-centered lens to both written material and interface design, focusing on how real users interpret information rather than how systems are implemented.
- Developed confidence in providing **constructive, structured UX feedback** to technical teams.
- Reinforced the importance of documentation as a **core product surface**, not an afterthought.

Human-Centered Perspective

- Approached documentation and UX evaluation as part of the same problem: reducing cognitive load for users.
- Demonstrated sensitivity to how small inconsistencies in language, visuals, or flows can undermine trust and usability.
- Contributed value without ownership of core codebases by improving **understanding, accessibility, and alignment**.

Reusable Professional Insight

- “This role reinforced that documentation and UX are not separate from engineering—they are often the primary way users experience a system.”
